

Transaction History

Date	Description	Amount
2026-06-01	Apex Properties Rent	50,000
2026-06-02	Metro Grocery Mart	12,500
2026-06-03	City Power & Light	8,500
2026-06-05	Shell Fuel Station	6,000
2026-06-08	Netflix Subscription	1,500
2026-06-10	Organic Foods Market	9,800
2026-06-12	Prime Video	1,200
2026-06-14	Downtown Bistro Dinner	7,500
2026-06-15	State Insurance Premium	11,000
2026-06-18	Metro Grocery Mart	11,200
2026-06-20	Gym Membership	4,500
2026-06-22	Shell Fuel Station	5,500
2026-06-25	Cloud Storage Auto-Renew	300
2026-06-25	Cloud Storage Auto-Renew	300
2026-06-28	Corner Coffee Shop	1,200
2026-06-29	Apparel Boutique	19,000
Total		150,000

Prompts

01: Write a script that finds recurring charges, possible forgotten subscriptions, and duplicate or repeated payments.

02: Explain the logic of the code in plain English, so you understand what it is doing.

03: Highlight the rows with recurring charges, possible forgotten subscriptions, and duplicate or repeated payments.

04: Generate HTML file as output

05: For auditing next month transaction history file make changes in the script so it prompts to upload transaction file or its path.

Logic

Step 1: Reading and Cleaning the Data

Before doing any math, the script imports your raw text list and converts it into a neat, searchable digital spreadsheet. Crucially, it tells the computer to treat the "Date" column as real calendar dates rather than just random strings of text. This allows it to understand timelines.

Step 2: The "Double Tap" Detector (Exact Duplicates)

The script looks for system glitches or accidental double-payments.

- **The Logic:** It scans the list to see if there is any instance where the **Date**, the **Description**, and the **Exact Amount** match perfectly across multiple rows.
- **The Result:** It successfully flags the two **Cloud Storage** charges on June 25th, because it is highly unusual to buy the exact same micro-subscription twice on the exact same afternoon.

Step 3: The Subscription Trap Finder (Recurring Bills)

This step hunts down your fixed monthly bills and sneaky subscriptions that automatically drain your account.

- **The Logic:** The script acts like a text scanner. It has a built-in "cheat sheet" of target words like *subscription*, *auto-renew*, *premium*, *gym*, and *membership*. It reads through every single row, converts the text to lowercase so capitalization doesn't break the search, and checks if any of those words appear.
- **The Result:** It isolates things like **Netflix**, **Prime Video**, and your **Gym Membership**, pulling them out of the pile so you can review if you actually still use them.

Step 4: The Habit Tracker (Repeated Vendors)

Finally, the script looks for patterns in where you shop, even if the amounts change each time (like gas stations or grocery stores).

- **The Logic:** To prevent slightly different text from throwing it off, the script looks at just the **first word** of the description (turning "Shell Fuel Station" into just "shell"). It then counts how many times each primary name appears. If a name appears more than once, it groups all those transactions together.
- **The Result:** It groups your two separate trips to **Shell** and your two separate trips to **Metro Grocery Mart**, giving you a clear view of your routine habits.
